

SportsMonitor

There is a large number of sites on the Internet that accept bets on sports events in leagues like NBA, CBA, NFL, CFB, MLB and NHL. However to win guessing on the game results is hard enough therefore it is necessary to spend a lot of time to learn teams' strengths and weaknesses, track leading players stats, view injuries reports and other contributing factors that are important in the decision making process of selecting winners.

The site www.sportshandicappingsservice.com gives visitors an opportunity to receive forecasts of future games results from professionals – handicappers (cappers) who perform all dirty work and always are up on sports events.

Several handicappers work on the site and each of them specialize in a specific sport based on their expertise.

Since the handicappers selections are based on real sports lines, users can rest assured that the predictions will mirror the same lines that are available to users across various sports wagering bookmakers.

The site www.sportshandicappingsservice.com is a commercial resource and cappers' forecasts are not free-of-charge. The user can choose from an array of selection packages that include a single game, daily selections from a particular capper, weekly selections, and even a seasons worth of selections. If the user wishes to receive several cappers' forecasts, he needs to buy a subscription to each of them separately. From time to time, the cappers offer free selection.

Naturally, the user should have an opportunity to estimate cappers productivity before buying a subscription to his forecasts. In order to maintain credibility and accountability to the betting public, results of all cappers forecasts become available 1 hour after the game time. Users that have paid subscriptions receive the selections via email as well as the website (based on a unique login / password to the user) at the time the selections are made by the handicapper.

The subscription payments are made either by credit cards or using PayPal payment system.

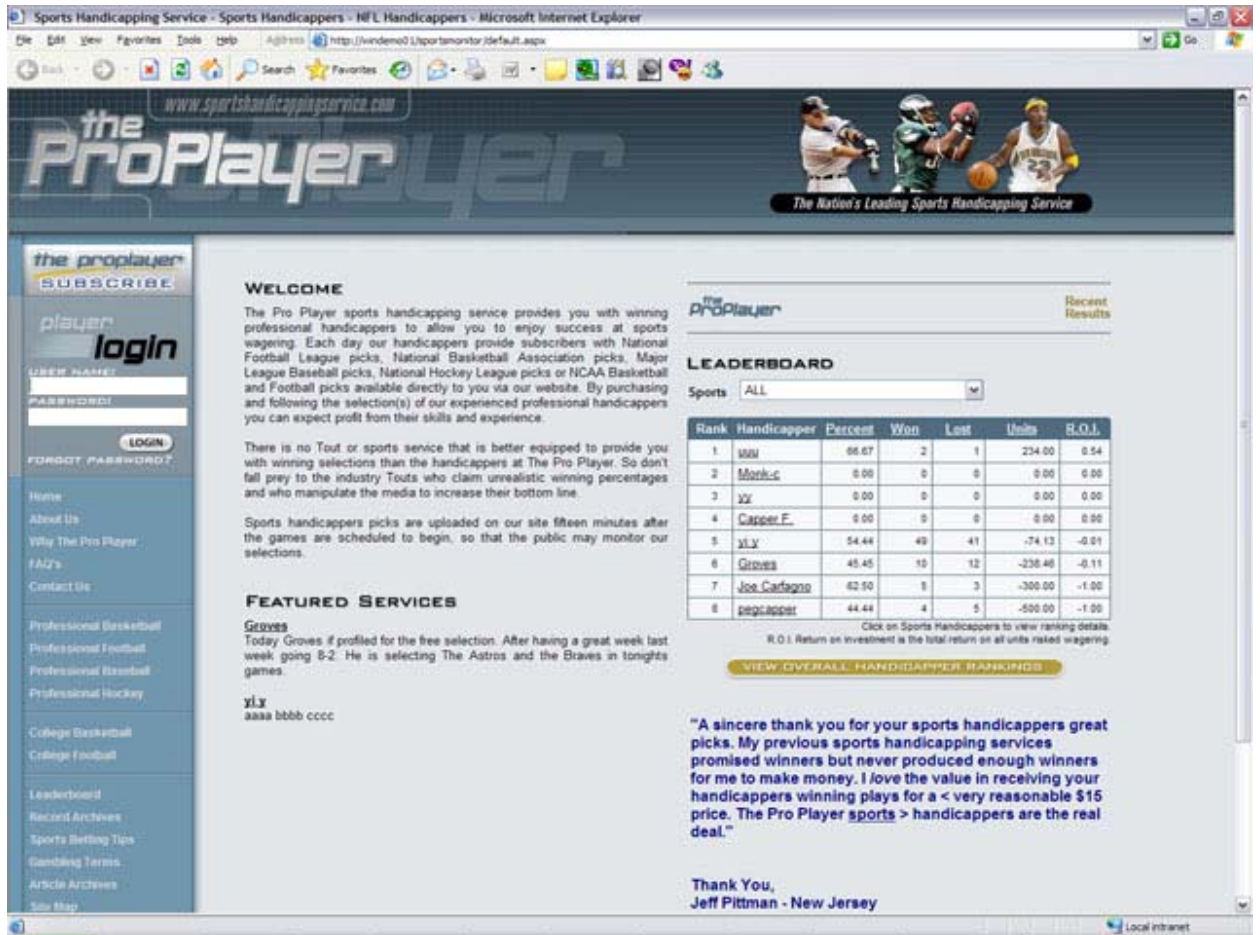

The web application is written using ASP.NET technology and the programming language C#. The library .Net Framework 1.1 version was used. The Database runs on MS SQL Server 2000 and ADO.NET technology has been used for interaction with it. Internet Explorer and Mozilla FireFox browsers are supported.
